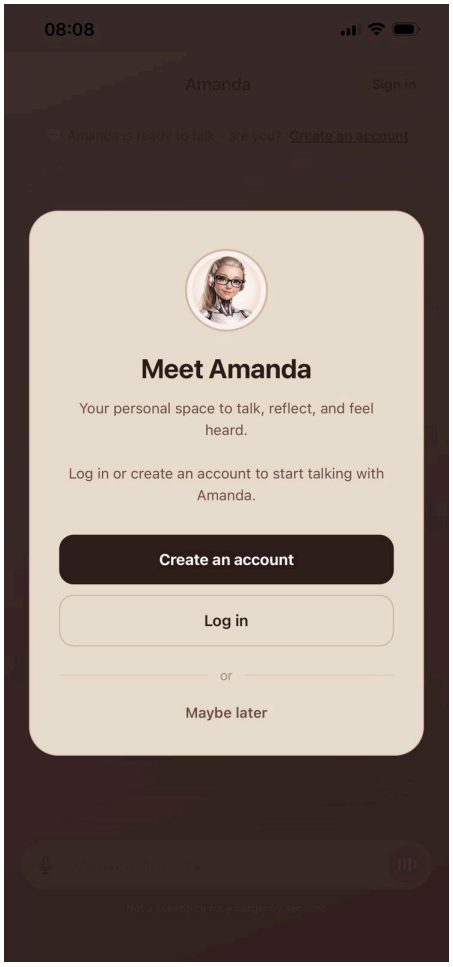
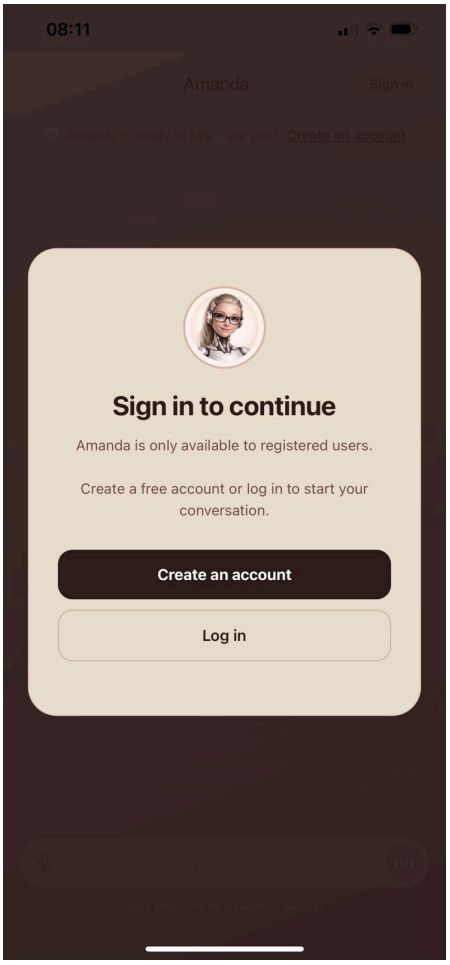
# User testing fixes

## 1. Login Modal

Before: Users could tap "Maybe later" to dismiss the modal and access the chat screen without an account, causing confusion and a loop when they tried to use features that required login. The chat was visible behind the modal.

After: Modal cannot be dismissed. "Maybe later" removed. Title changed to "Sign in to continue" with clear messaging that an account is required. The background is fully blocked.

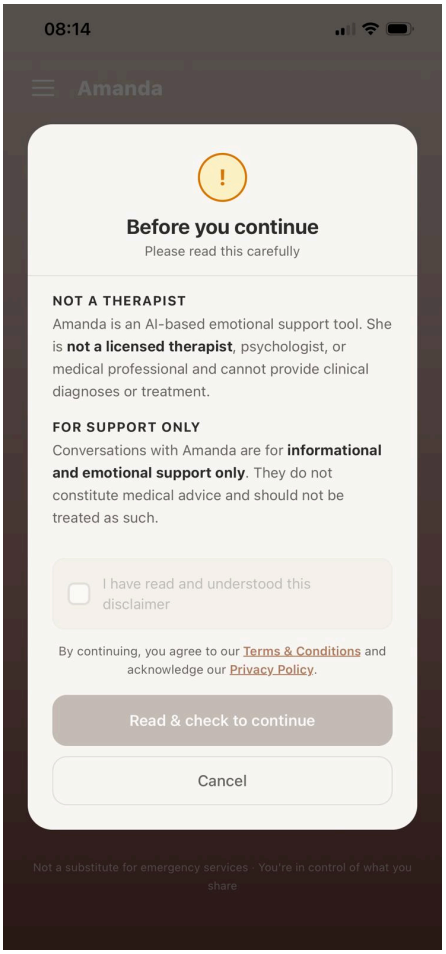


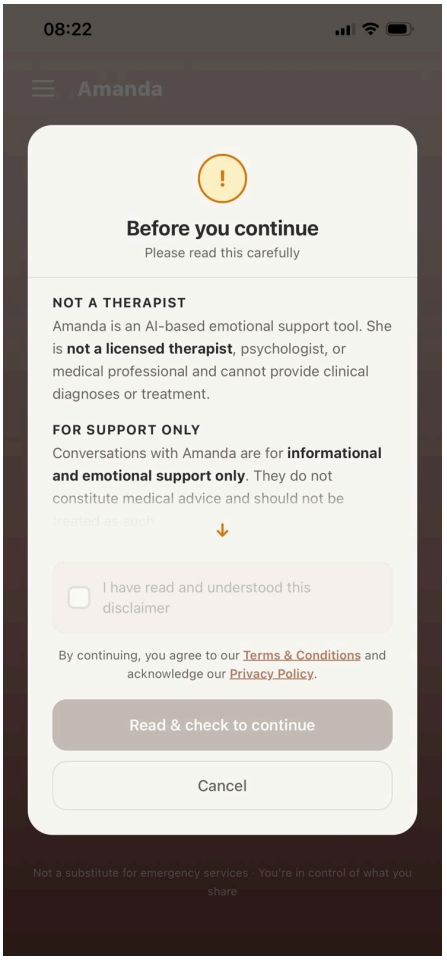


## 2. Disclaimer

Before: Showed every time the user tapped "Talk to me!" regardless of whether they had accepted it before. Users had to scroll, check a box, and accept on every visit. No visual cue that there was more to scroll.

After: Shows once per device during the first visit (typically at signup). A fade gradient with a down arrow appears at the bottom of the scroll area to signal more content is below. Once accepted, the acceptance is saved to the device. Every subsequent tap on "Talk to me!" goes straight to chat. The disclaimer also won't re-appear at the end of the app tour if the user has already accepted it.

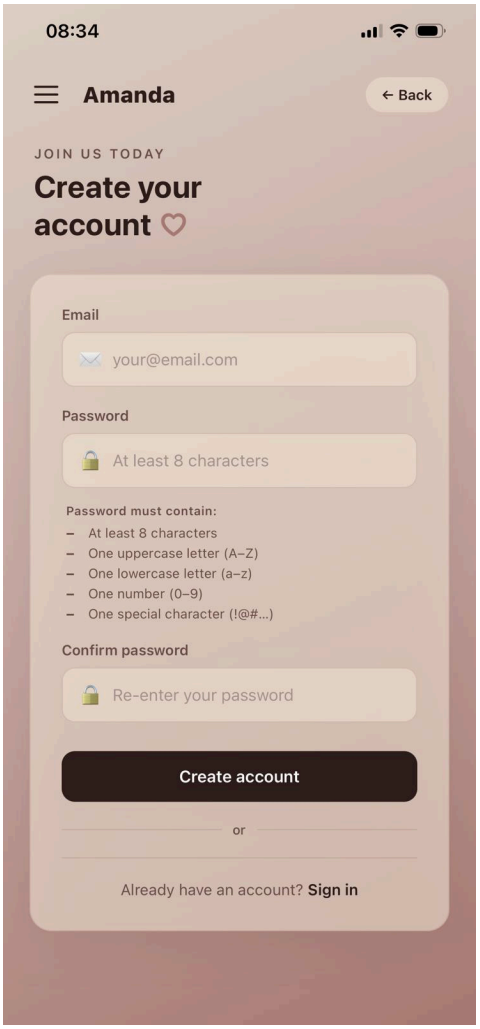


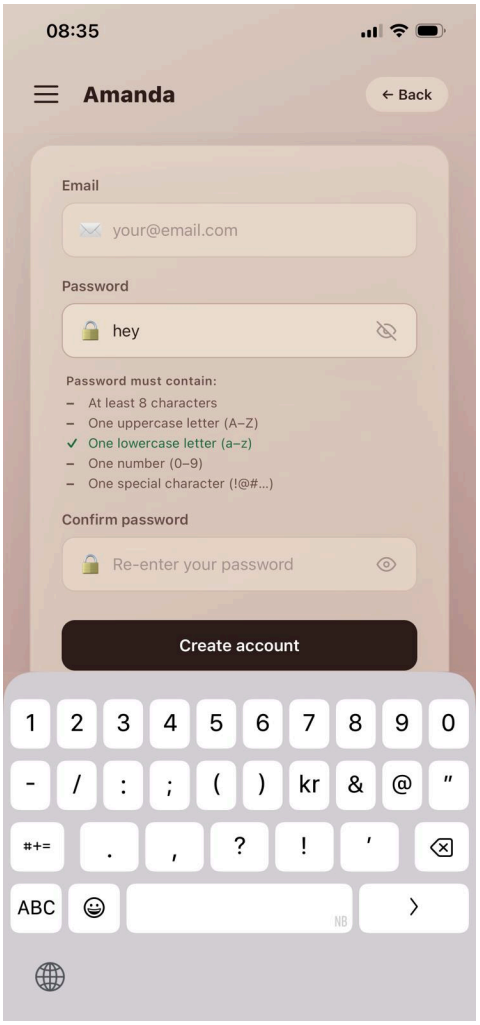


### 3. Password Fields

Before: Password fields on signup and login had no way to view what was typed. secureTextEntry was fixed to always on, so users could not see their password at any point. Editing a mistake meant deleting and retyping the whole password.

After: A toggle eye icon appears on the right side of every password field. Tapping it reveals the password as plain text, tapping again hides it. Users can now spot typos and edit individual characters without retyping from scratch. The fix lives in the shared InputField component so it applies to both signup and login automatically.

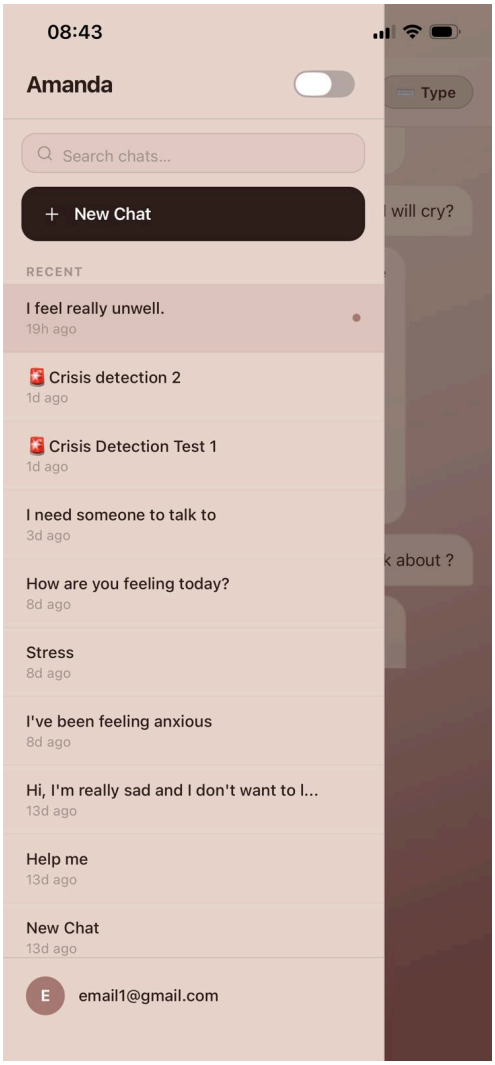


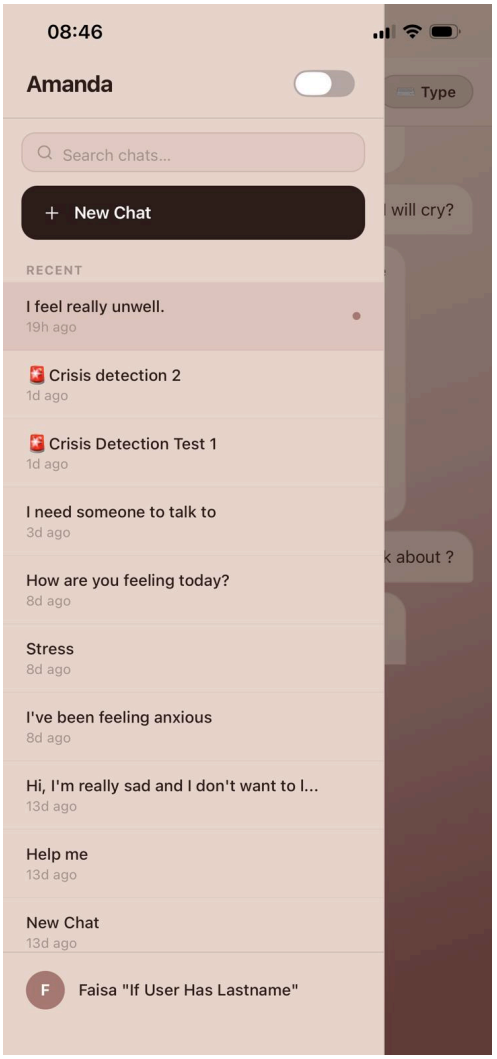


### 4. Profil Panel - Name instead of email

Before: The sidebar footer displayed the user's email address. This is feels impersonal and exposes credentials in a place the user sees every time they open the sidebar.

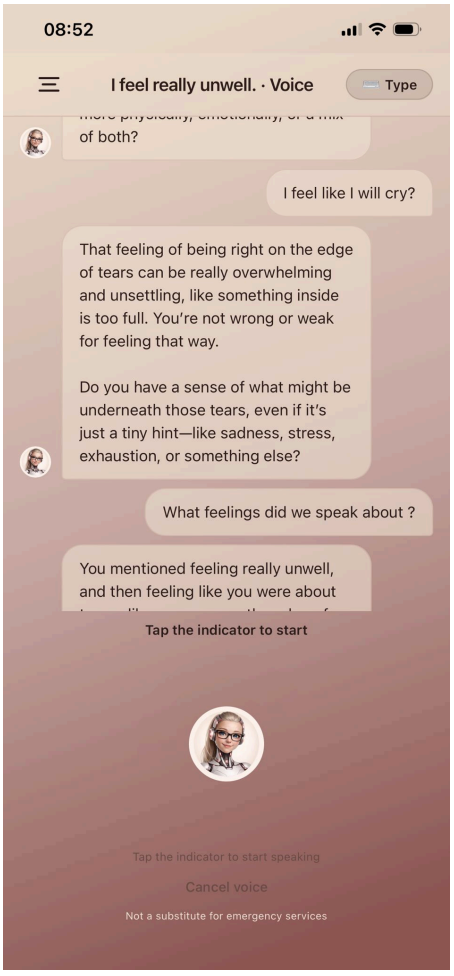
After: The sidebar footer now displays the user's first name and last name (e.g. "Faisa Ahmed"). If only a first name is saved it shows that alone. If no name has been set yet it falls back to the email so the footer is never empty. The avatar initial also updates to match the name. The email stays where it belongs: in the account/profile settings only.

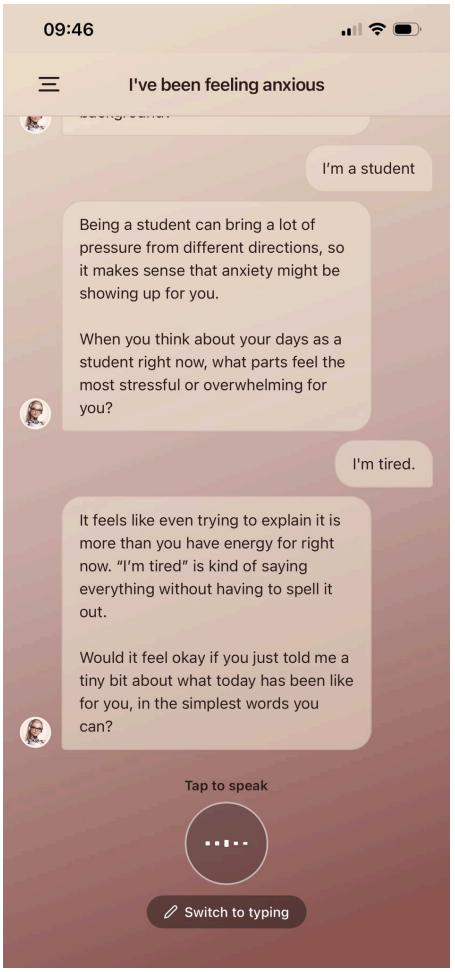




5. **Voice chat**

Before: The only way to exit voice mode was a small "Type" button in the top right corner of the navbar. Users missed it entirely or found it too small. No visual feedback when the user stopped speaking. Amanda's photo sat in the centre of the indicator with faint pulsing rings. The voice indicator colour never changed so there was no way to tell what Amanda was doing. The chat title showed "Chat name - Voice" in voice mode. Conversation starter chips were tappable in voice mode, allowing users to accidentally send a text message while in a voice session. Amanda's response text appeared all at once after she finished speaking.

After:




- "Switch to typing" button moved to the bottom of the voice bar, directly below the indicator where users naturally look. Solid button with icon and clear label.
- Visual feedback per phase: the indicator circle changes colour based on what is happening. Idle is neutral, listening is a glowing rosy pink, thinking is muted mauve, speaking is warm rose.
- "Tap to speak" replaces the old hint text. All text under the indicator removed.
- Footer hidden in voice mode to give the layout more breathing room.
- Chat title no longer appends "Voice" in voice mode.
- Conversation starter chips are hidden in voice mode. Title and subtitle remain visible.
- Amanda's voice response text now reveals gradually using a typewriter effect as she speaks rather than dumping the full message at once. **Note**: the animation starts when the full transcript arrives from the server. Syncing it to her actual speech requires backend streaming of transcript tokens, same as text chat.
